AUTOMATIC COVER

The new Westec housing are provided with a special closing system that allows the automatic closure of the cover guaranteeing the IP66 degree (IP69K with lever). Presently, when the operator disconnects the mobile connector from the machine, for any reason (transport, maintenance, cleaning, etc.), must protect the fixed connector's insert applying and manually locking the cover by the lever: thus to avoid that the further operations or weather events (rain and other liquids) could damage the fixed connector and electrical equipment.

The new Westec housing called "AUTOMATIC COVER",

protect the fixed connector and the electrical equipment full automatically, just when the mobile connector is disconnected, so that the operator can forget to close it manually. The cover closure is obtained through the combination of mechanical and magnetic mechanism that permit the cover firm closing. These housing can be coupled with all mobile enclosures with single lever locking system. Therefore, Automatic cover is the sole system currently present on the heavy duty connectors market, that guarantee safety, in particular in the fields of automotive, food equipment and all outdoor applications.

YOU'LL NEVER FORGET TO CLOSE IT!
